AA	Application Association
AARE	Application Association Response
AARQ	Application Association ReQuest
AL	Application layer
AP	Application process
APDU	Application Protocol Data Unit
ASE	Application Service Element
A-XDR	Adapted Extended Data Representation
base_name	The short_name corresponding to the first attribute ("logical_name") of a COSEM object
class_id	Interface class identification code
COSEM	Companion Specification for Energy Metering
COSEM object	An instance of a COSEM interface class
DHCP	Dynamic Host Control Protocol
DLMS	Device Language Message Specification
DNS	Domain Name Server
GMT	Greenwich Mean Time. Replaced by Coordinated Universal Time (UTC).
GPS	Global Positioning System
GPRS	General Packet Radio Service
GSM	Global System for Mobile Communications
HDLC	High-level Data Link Control
HLS	High Level Security
IC	Interface Class
IEC	International Electrotechnical Commission
IEEE	Institute of Electrical and Electronics Engineers
IP	Internet Protocol
ISO	International Organization for Standardization
LLC	Logical Link Control (Sublayer)
LLS	Low Level Security
LN	Logical Name
LSB	Least Significant Bit
MSB	Most Significant Bit
OBIS	OBject Identification System
PDU	Protocol Data Unit
PPP	Point-to-Point Protocol
PSTN	Public Switched Telephone Network
SAP	Service Access Point

2 General description

This document describes the implementation details for the DLMS/COSEM communication in Kamstrup electricity meters OMNIPOWER single-phase (incl. OMNIPOWER single-phase ST), OMNIPOWER three-phase, OMNIPOWER CT, K382M (incl. K162M) and K351C. The implementation complies with the following standards:

- Blue Book, 10th edition, (DLMS UA 1000-1:2007, 10th Edition)
- Green Book, 7th edition, (DLMS UA 1000-2:2007, 7th Edition)

The meters are tested according to the specification defined in the Yellow Book for the DLMS certification.

The purpose of this document is to describe the choices taken to define the logical functionality of Kamstrup electricity meters.

Some manufacturer specific objects have been defined. Manufacture specific objects are used for supporting e.g. Breaker, Pre-payment, Demand registers, Tariff and Load control features as well as manufacture specific configurations.

For information on manufacture specific objects not found within this document in paragraph 3, refer to Technical Description for actual electricity meter or contact Kamstrup EL-Kamstrup@produkt.com.

2.1 Client/server type operation, communication profile

Data exchange between data collection systems and Kamstrup electricity meters using the COSEM interface object model is based on the client/server paradigm. Kamstrup electricity meter play the role of the server.

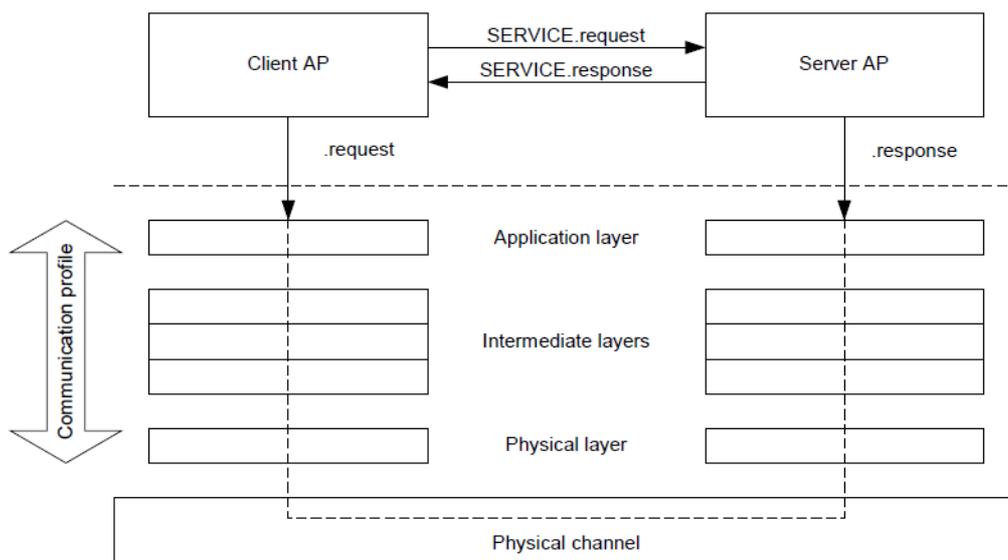

Figure 1 Client/server relationship and protocols

2.2 Connection (association) oriented operation

To be able to exchange data between the client and a server they have to be associated.

This is done as shown in the Figure 2. Kamstrup electricity meters automatically disconnects when no activity as defined by the `inactivity_time_out` value within the HDLC Setup class (Default value is 20 s). For examples of communication see paragraph 4.

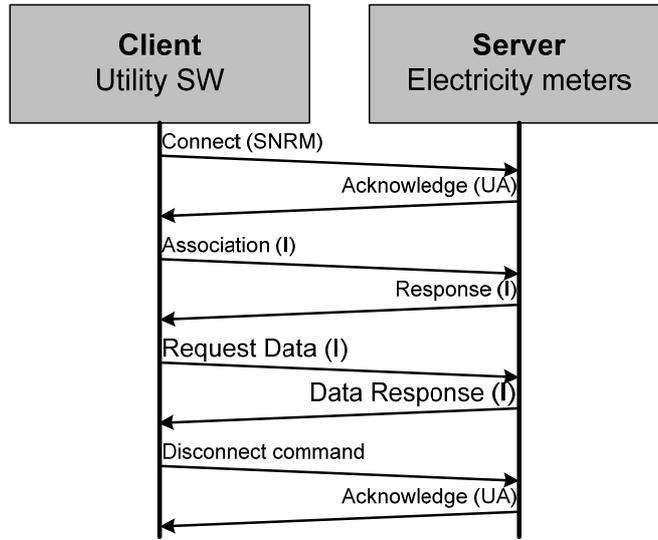

Figure 2 Complete communication session

Depending on the Application Association (AA) established between the client and the server, different access rights are granted by the server. Access rights concern a set of COSEM objects – the visible objects – that can be accessed (‘seen’) within the given AA. In addition, access to attributes and methods of these COSEM objects may also be restricted within the AA (for example a certain type of client can only read a particular attribute of a COSEM object, but cannot write it).

The list of the visible COSEM objects – the “association view” – can be obtained by the client by reading the “*object_list*” attribute of the appropriate association object.

2.3 Referencing methods

Attributes and methods of COSEM objects can be referenced in two different ways:

Kamstrup electricity meters use logical names (LN referencing): In this case, the attributes and methods of a COSEM interface object are referenced via the identifier of the COSEM object instance to which they belong.

The reference for an attribute is: class_id, value of the 'logical_name' attribute, attribute_index.

The reference for a method is: class_id, value of the 'logical_name' attribute, method_index.

Where:

- attribute_index is used as the identifier of the attribute required. Attribute indexes are specified in the definition of each IC. They are positive numbers starting with one. Proprietary attributes may be added: these shall be identified with negative numbers;
- method_index is used as the identifier of the method required. Method indexes are specified in the definition of each IC. They are positive numbers starting with one. Proprietary methods may be added: these shall be identified with negative numbers.

2.4 Specification Application layer

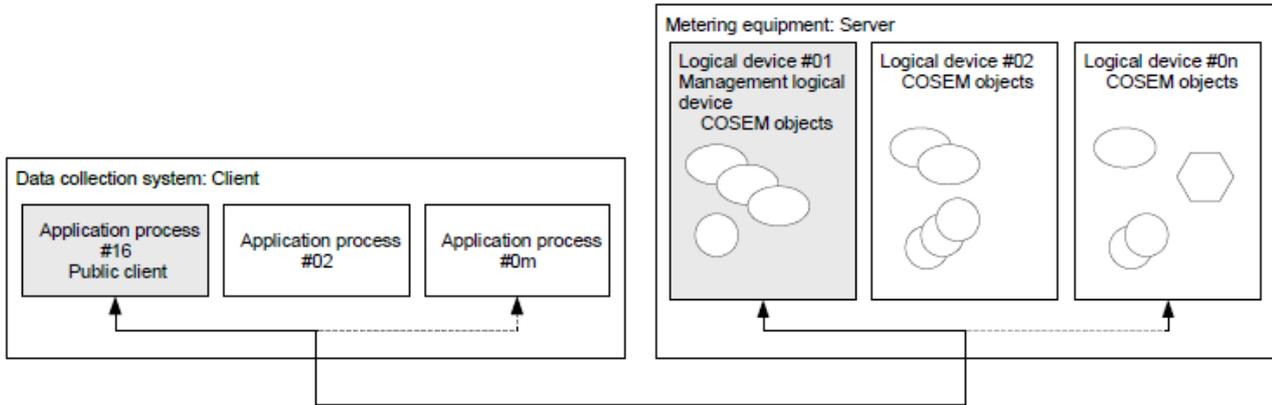

Figure 3 COSEM application model of a data collection system and metering equipment

Objects that share common characteristics are generalized as an IC, identified with a class_id. Within a specific IC, the common characteristics (attributes and methods) are described once for all objects. Instantiations of ICs are called COSEM interface objects.

Figure 4 illustrates these terms by means of an example:

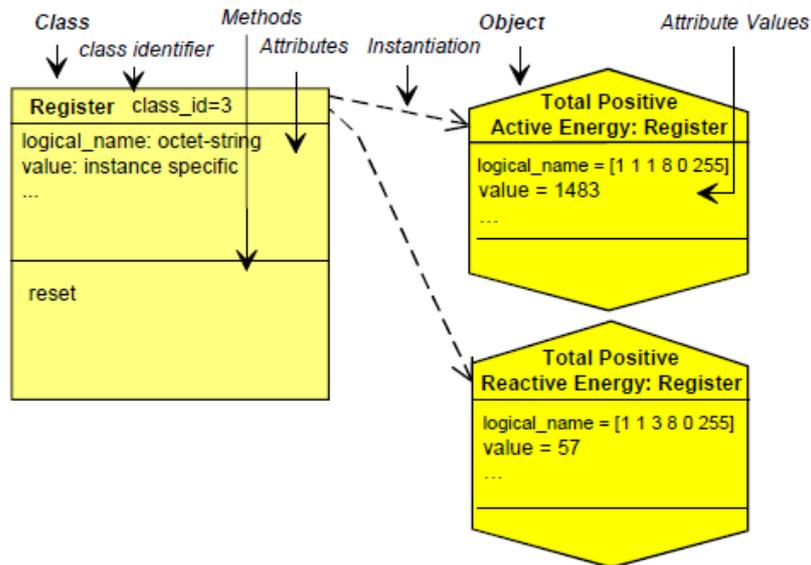

Figure 4 Example of interface class and its instances

The IC “Register” is formed by combining the features necessary to model the behavior of a generic register (containing measured or static information) as seen from the client (data collection system, hand held terminal). The contents of the register are identified by the attribute “logical_name”. The logical_name contains an OBIS identifier. The actual (dynamic) content of the register is carried by its “value” attribute.

2.4.1 Implemented classes

The following classes are implemented:

- Data (Class 1)
- Register (Class 3)
- Extended register (Class 4)
- Profile generic (Class 7)
- Clock (Class 8)
- Association LN (Class 15)
- SAP (Class 17)
- Image transfer (Class 18)
- HDLC Setup (Class 23)

All defined objects with their access rights, depending on the current association, are listed paragraph 3.

2.4.2 Management Logic device

The objects of the Management Logic device can be accessed using the public association without security as required by the standard.

Public Association without security (No security):

- Client SAP: 16
- Server SAP: 1
- Context name: Logical name addressing
- Mechanism name: No security
- Conformance: GET, Block transfer with GET

The following objects are available for all meter types using the public association on all interfaces.

Access rights for all objects are read (R).

Class_id	Ver.	Name	Logical Name	Access	K351C	K382M	OMNIPOWER 1- and 3 phase	OMNIPOWER CT
23	1	HDLC Setup class	0.0.22.0.0.255	R	●	●	●	●

Table 2-1 Object list - Public Association

Table 2-2 is an example of register values and data types. SerialNo (1.1.96.1.0.255) and the CompleteMeterTypNo (1.1.96.1.1.255) are both unique identifiers for the actual meter. MeterNo1 (1.1.0.0.1.255) is a reprogrammable meter number and SoftwareNumberRevisionAscii (1.1.0.2.0.255) is the identifier for the software incl. revision.

Class_id	Ver.	Name	Logical Name	Value (example)	Data Type
23	1	HDLC Setup class	0.0.22.0.0.255		
15	0	Association LN class	0.0.40.0.0.255

1	0	SerialNo	1.1.96.1.0.255	19083074	Unsigned32
1	0	CompleteMeterTypeNo	1.1.96.1.1.255	6851125CD140111040	Visible-String

Table 2-2 Example of register values and data type (OMNIPOWER CT)

2.4.3 Electric meter logic devices

The Electric meter logic device models the data of the Kamstrup electrical meter.

Primary Module interface Association with Low Level security (Password protected)

- Client SAP: 18
- Server SAP: 16
- Context name: Logical name addressing
- Mechanism name: Low Level security. Password default is '12345'
- Conformance: GET, Block transfer with GET, SET, ACTION, SELECTIVE ACCESS

Optical interface Association with Low Level security (Password protected)

- Client SAP: 19¹
- Server SAP: 16
- Context name: Logical name addressing
- Mechanism name: Low Level security. Password default is '12345'
- Conformance: GET, Block transfer with GET, SET, ACTION, SELECTIVE ACCESS

Association used from Module_Port_2 interface:

CCC Module interface Association with Low Level security (Password protected):

- Client SAP: 20²
- Server SAP: 16
- Context name: Logical name addressing
- Mechanism name: Low Level security. Password default is '12345'
- Conformance: GET, Block transfer with GET, SET, ACTION, SELECTIVE ACCESS

For a list of objects available for Module Interface and Optical Interface associations, refer to paragraph 3.

¹ For OMNIPOWER software revision F1 (Only) the Client SAP is 20.

² For OMNIPOWER software revision F1 (Only) the Client SAP is 19.

2.5 Specification Data Link Layer

The 3-layer, connection-oriented, HDLC-based profile is used for all communication with Kamstrup electricity meters.

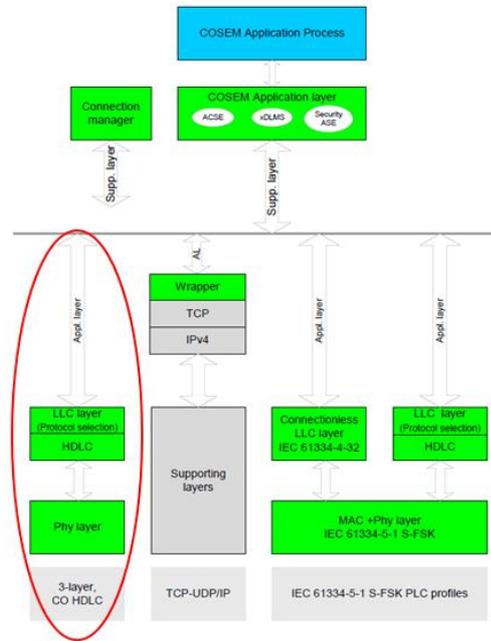

Figure 5 DLMS/COSEM communication profile

- Communication profiles: HDLC
- Inactivity timeout³: Configurable with object 0.0.22.0.0.255 Attr. 8. Default value is 20 s.
- Interframe timeout: Configurable with object 0.0.22.0.0.255 Attr. 7. Default value is 500 ms.
- Response timeout: 2 s
- Disc to NDM timeout: 100 ms
- Addressing schemes: 1 byte, 2 byte and 4 byte
- Physical address: Configurable with object 0.0.22.0.0.255 Attr. 9. Default address is 32.
- Info size RX: 1010⁴ (0x3F2)
- Info size Tx: 1010⁵ (0x3F2)
- Window size receive: 1
- Window size transmit: 1

2.6 Specification Physical Layer

³ If this value is set to 0 inactivity timeout is disabled.

⁴ In OMNIPOWER M1 the Info size RX (from meter) was increased to 1010, for K382M and K351C the Info size RX is 512. All meters are supporting segmentation.

⁵ In OMNIPOWER T1 the Info size TX (to meter) was increased to 1010, for K382M and K351C the Info size TX is 128.

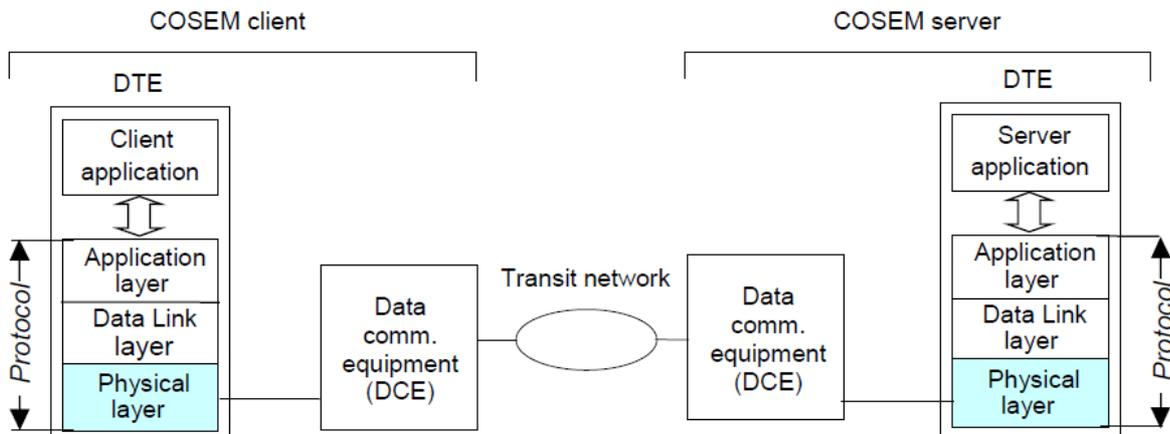

Figure 6 Location of the physical layer

- Opening mode: Direct HDLC
- Echo: None
- Baud rate : 9600 bps N81
- TCP/IP port: 1025 (Using IP101i module)
- TCP/IP port: 4059 (Using GSM8i 2G module⁶, 6819XXXXXXXX)
- UDP/IP port: 4059 (Using GSMD 2G module, 681CXXXXXXXX)

For interfacing Kamstrup electricity meters via TCP/IP module (IP101) or GSM modems refer to applicable interface guide (5512-609, 5512-1129 or 5512-1533).

The frame format of the HDLC frame is show in Figure 1. The length of the flag field is one byte and its value is 0x7E.

Flag	Frame format	Dest.address	Src. address	Control	HCS	Information	FCS	Flag
------	--------------	--------------	--------------	---------	-----	-------------	-----	------

Figure 1 HDLC Frame format type 3

2.6.1 Frame format field

The length of the frame format field is two bytes. It consists of three sub-fields referred to as the Format type sub-field (4 bit), the Segmentation bit (S, 1 bit) and the frame length sub-field (11 bit), as it is shown in Figure 7.

⁶ GSM8i 2G from SW revision A4

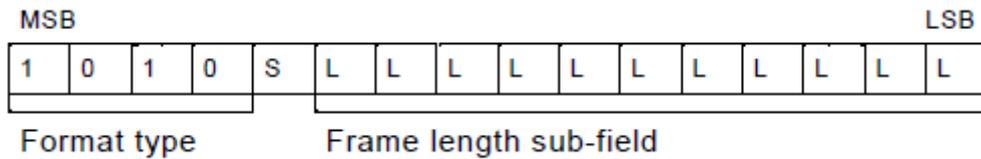

Figure 7 Frame format field

The value of the format type sub-field is 1010 (binary), which identifies a frame format type 3.

2.6.2 Destination and source address fields

There are exactly two address fields in this frame: a destination and a source address field.

2.6.3 Control field

The length of the control field is one byte. It indicates the type of commands or responses, and contains sequence numbers, where appropriate (frames I, RR and RNR).

2.6.4 Header check sequence (HCS) field

The length of the HCS field is two bytes. This check sequence is applied to only the header, i.e., the bits between the opening flag sequence and the header check sequence. Frames that do not have an information field or have an empty information field, e.g., as with some supervisory frames, do not contain an HCS and FCS, only an FCS.

2.6.5 Information field

The information field may be any sequence of bytes. In the case of data frames (I and UI frames), it carries the MSDU.

2.6.6 Frame check sequence (FCS) field

The length of the FCS field is two bytes. Unless otherwise noted, the frame checking sequence is calculated for the entire length of the frame, excluding the opening flag, the FCS and any start and stop elements (start/stop transmission).

2.6.7 Address field structure

The HDLC frame format contains two address fields: a destination and a source HDLC address.

The client address is always expressed using one byte.

The server address – to enable addressing more than one logical device within a single physical device and to support the multi-drop configuration – is divided into two parts:

- The upper HDLC address which is used to address a Logical Device (a separately addressable entity within a physical device);
- The lower HDLC address which is used to address a Physical Device (a physical device on the multi-drop).

The upper HDLC address is always present. The lower HDLC address may be omitted if it is not required.

The HDLC address extension mechanism applies to both parts. This mechanism specifies variable length address fields, but for the purpose of this protocol, the length of a complete server address field is restricted to be one, two or four bytes long, as shown on Figure 8.

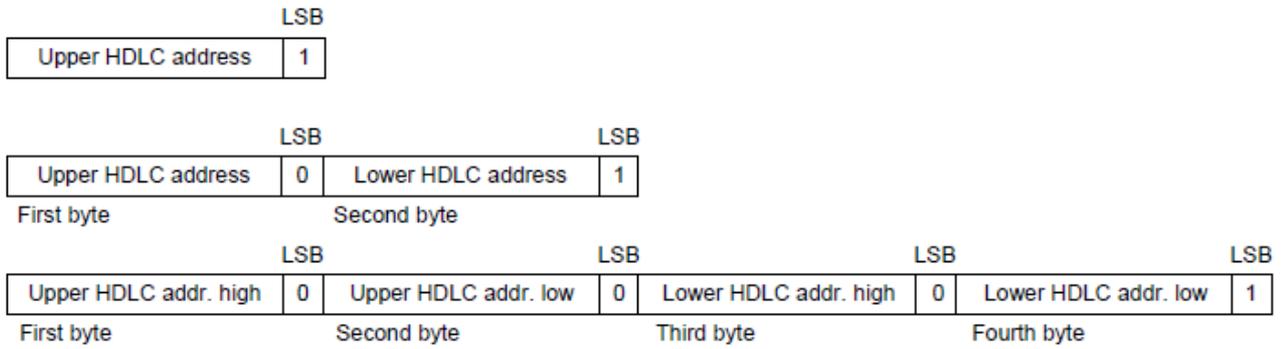

Figure 8 Valid server address structures

3 Object list

In the following sub paragraphs all objects with access rights and data types are listed for each implemented class. All objects are available via Module Interface or Optical Interface associations. Attr. 2 access rights indicated with R(W) means that write access is limited to only the primary module port.

3.1 Data Class (Class_id: 1)

Class_id	Ver.	Name / Description	Attr. 1 Logical Name	Attr. 2 (example)	Attr. 2 Access	Attr. 2 Data Type	K351C	K382M	OMNIPOWER 1- and 3 phase	OMNIPOWER CT

Attributes:

- 1) logical_name
- 2) buffer
- 3) capture_objects
- 4) capture_periode (300s, 900s, 1800s or 3600s)
- 5) sort_method
- 6) sort_object
- 7) entries_in_use
- 8) profile_entries

Table 3-1 shows the generic layout of all loggers within the electricity meters. The two manufacture specific attributes which are available for the debiting loggers, load profile logger and analysis logger (Data loggers) are described in paragraph 3.4.1 and 3.4.2. For details on the logger specific register values refer to Technical description for actual electricity meter or read the capture objects for the specific Profile generic object.

Generic Profile buffer layout		
Logical_name	Attr.	
0.1.1.0.0.255	2	RTC
Profile logical_name	255	LoggerStatus
Profile logical_name	254	DataQuality
1.1.134.0.1.255	2	Reserved / Not Used
1	2	Logger specific register value
..	2	Logger specific register value
n	2	Logger specific register value

Table 3-1 Generic Profile buffer layout (data loggers)

3.4.1 Manufacture specific LoggerStatus attribute

Value	Description	
2bytes 0-65535	Bit 0	Unused
	Bit 1	Unused
	Bit 2	Unused
	Bit 3	1 = Log invalid due to incorrect crc
	Bit 4	Unused
	Bit 5	Unused
	Bit 6	1 = Time discontinuity – Log's are not filled up after SetClk or PowerOutage
	Bit 7	1 = Logger is reconfigured
	Bit 8	1 = Log interval changed
	Bit 9	1 = LogId has reached 0xFFFFFFFF – no further logs
Bit 12-15	Unused	

Figure 9 LoggerStatus

3.4.2 Manufacture specific DataQuality attribute

Value	Description	
4 bytes	Bit 0	Clock set between 7-15s (default values)
	Bit 1	Clock set between 15-30s (default values)
	Bit 2	Clock set between 30-60s (default values)
	Bit 3	Clock set more than 60s (default values)
	Bit 4	Clock set forward
	Bit 5	Clock set backward
	Bit 6	Legal Param error
	Bit 7	Overvoltage
	Bit 8	Undervoltage
	Bit 9	Neutral Error
	Bit 10	Power Outage
Bit 11-31	For future use	

Figure 10 DataQuality in loggers

3.4.3 Parameters for selective access to the buffer attribute

Selective access using access selector 0, 1 or 2 is possible, see Table 3-2.

Access selector	Access parameter	Comment
0		All buffer elements is returned in the response
1	range_descriptor (From Time, To Time)	Only buffer elements corresponding to the range_descriptor is returned in the response.
2	entry_descriptor (From Entry, To Entry)	Only buffer elements corresponding to the entry_descriptor is returned in the response.

Table 3-2 Selective acces used when reading buffers / logger

3.4.3.1 Selective access Entry range (Assecc selector = 2)

Only Buffer elements corresponding to the entry_descriptor are returned in the buffer attribute response:

Entry_descriptor structure:

From_entry	First entry (row) to retrieve
To_entry	Last entry (row) to retrieve To_entry==0: The newest log
From_selected_value	Index of first value (column) to retrieve
To_selected_value	Index of last value (column) to retrieve To_selected_value==0: highest possible selected_value

Example 1:

This example does readout the logger backward from entry 1 to entry 3

From_entry = 1, To_Entry = 3

From_selected_value = 2, To_selected_value = 4

The entries marked with gray in the logger layout below are readout starting with entry 1 and selected value 2:

Profile Logger	Selected value (Column)				
Entry (Row)	1	2	3	4	5 (0: Highest)
4 (Oldest log)					
3		Buffer idx[2]	Buffer idx[2]	Buffer idx[2]	
2		Buffer idx[1]	Buffer idx[1]	Buffer idx[1]	
1		Buffer idx[0]	Buffer idx[0]	Buffer idx[0]	
0 (Newest log)					

Example 2:

This example does readout the logger forward from entry 1 to entry 0 by using wildcard for selected value which means the last column.

From_entry = 1, To_Entry = 0

From_selected_value = 1, To_selected_value = 0

The entries marked with gray in the logger layout below are readout starting with entry 1 and selected value 1:

Profile logger	Selected value (Column)				
Entry (Row)	1	2	3	4	5 (0: Highest)
4 (Oldest log)					
3					
2					
1	Buffer idx[0]	Buffer idx[0]	Buffer idx[0]	Buffer idx[0]	Buffer idx[0]
0 (Newest log)	Buffer idx[1]	Buffer idx[1]	Buffer idx[1]	Buffer idx[1]	Buffer idx[1]

3.4.4 RTC logger

Description of logged objects not part of the Object list:

Class_id	Ver.	Name / Description	Attr. 1 Logical Name	Attr 2. Access	Attr 4- 7,9. Access	Attr 8. Access	K351C	K382M	OMNIPOWER 1- and 3 phase	OMNIPOWER CT

Figure 11 Example of Clock Class (K351C, Optical interface)

Attributes:

- 1) logical_name
- 2) date_time
- 3) time_zone, not used.
- 4) status
- 5) daylight_savings_begin
- 6) daylight_savings_end
- 7) daylight_savings_deviation
- 8) daylight_savings_enabled
- 9) clock_base

3.5.1 Date and time formats

Date and time information is represented with date_time format, as defined below:

<i>date_time</i>	OCTET STRING (SIZE(12)) { year highbyte, year lowbyte, month, day of month, day of week, hour, minute, second, hundredths of second, deviation highbyte, deviation lowbyte, clock status ⁷ } Individual fields of date_time are encoded as defined in "blue book". Some may be set to "not specified" as described.
------------------	--

Figure 12 RTC date and time format

3.5.2 Clock status

Clock status is used in relation to day light saving time to adjust the internal RTC time which is used by the electricity meter for loggers.

When setting the time between daylight_savings_begin and daylight_savings_end bit 7 needs to be set and setting the time outside DST bit 7 needs to be cleared.

When reading RTC values the clock status (bit7) indicates if the time is adjusted for daylight saving or not.

⁷ Note: Only Bit0 (Invalid) & Bit7 (DST) in clock status are supported.

3.6 Association LN Class (Class_id: 15)

Class_id	Ver.	Name / Description	Attr. 1 Logical Name	Attr 2-6. Access	Attr 7. Access	Attr 8. Access	K351C	K382M	OMNIPOWER 1- and 3 phase	OMNIPOWER CT

Figure 15 Example of Image transfer Class (OMNIPOWER, Primary Module interface)

Attributes:

- 1) logical_name
- 2) image_block_size⁸
- 3) image_transferred_blocks_status
- 4) image_first_not_transferred_block_number
- 5) image_transfer_enabled
- 6) image_transfer_status
- 7) image_to_activate_info

⁸ Max recommended block size using GPRS is 983 (without segmentation)

Methods:

- 1) `image_transfer_initiate`
- 2) `image_block_transfer`
- 3) `image_verify`
- 4) `image_activate`

3.8.1 Image transfer process description

Precondition: The Image transfer has to be enabled: `image_transfer_enabled = TRUE`.

Step 1: Get/modify ImageBlockSize

The client can either read the current value of the `image_block_size` attribute and use this value during the Image transfer process or modify the `image_block_size` attribute to the desired value.

The range of `image_block_size` is 32 – 985 octets.

Step 2: Client initiates Image transfer

The client initiates the Image transfer process by invoking the `image_transfer_initiate` method. The method invocation parameter holds the identifier and the size of the Image to be transferred:

`image_identifier: 0xHHHHHHHHO00,`

where H = Hash of the Image and O = originatorID

`image_size:` holds the total ImageSize in octets, max. value is 512 kB

After a successful initiation the value of the `image_transfer_status` attribute is (1). The `image_transferred_block_status`, `image_first_not_transferred_block_number` and `image_to_activate_info` attributes are all reset.

Step 3: Client transfers ImageBlocks

The client transfers ImageBlocks to server by invoking the `image_block_transfer` method. The method invocation parameters include the ImageBlockNumber and one ImageBlock:

`image_block_number:` is checked by the server to be within the expected range

`image_block_value:` is checked by the server – must be equal the `image_block_size` attribute, except for the final ImageBlock.

Step 4: Client checks completeness of the Image

The client checks the completeness of the Image transferred. If the Image is not complete, it transfers the ImageBlocks not (yet) transferred. This is an iterative process, continued until the whole Image is successfully transferred.

To identify and transfer the ImageBlocks not transferred, two mechanisms are available.

- the client may retrieve the status of each ImageBlock: either not transferred or transferred. This is performed by retrieving the value of the *image_transferred_blocks_status* attribute. The client transfers then the ImageBlocks not (yet) transferred;
- alternatively, the client may retrieve the ImageBlockNumber of the first block not transferred. This is performed by retrieving the value of the *image_first_not_transferred_block_number* attribute. The client transfers then this ImageBlock not (yet) transferred;
- after this, the client checks again the completeness of the Image.

Step 5: Server verifies the Image

The Image is verified by the server. The client is initiating the verification by invoking the *image_verify* method. The result can be:

- temporary-failure, if the verification could be started - *image_transfer_status* attribute is (2);
- other-reason (or other value), if the verification could not be started - *image_transfer_status* attribute remains untouched.

In case the verification could be started (verification takes some seconds) the result can be either success or failed. If success - *image_transfer_status* attribute is (3). If failed - *image_transfer_status* attribute is (4).

Furthermore if success – the *image_to_activate_info* attribute is updated with the information on the Image ready for activation:

image_to_activate_size: is the size of the Image to be activated, expressed in octets

image_to_activate_identification: 0xNNNNNNNNRRRRRRRR, where N = software number and R = Revision

image_to_activate_signature: Hash calculated on the Image ready for activation

Step 6 (Optional): Client checks the information on the image to activate

If the information in the *image_to_activate_info* attribute is not what is expected, the client can restart the image transfer process.

Otherwise it goes to the next step, activation of the Image

Step 7: Server activates the Image

The Image is activated by the server. The client is initiating the activation by invoking the *image_activate* method. The result of the invocation of the *Image_activate* method can be:

- success, if the Image activation has been successfully started - *image_transfer_status* attribute is (6);
- temporary-failure, if the activation has not been successfully started - *image_transfer_status* attribute is (7);
- other-reason (or other value), if the activation failed - *image_transfer_status* attribute remains untouched.

In case of success, the server will reboot after 10 seconds and activate the new Image if possible. During this process, it is not accessible.

After the reboot - *image_transfer_status* attribute is (0) independent of the result of the activation.

The result of the activation may be checked by the client by retrieving the SoftwareRevision of the active firmware.

Image transfer cancellation

A running image transfer process can be cancelled at any time in two ways:

- Write the *image_block_size* attribute - *image_transfer_status* attribute is (0);
- Restart the image transfer process by invoking the *image_transfer_initiate* method - *image_transfer_status* attribute is (1).

3.9 HDLC Setup Class (Class_id: 23)⁹

Class_id	Ver.	Name / Description	Attr. 1 Logical Name	Attr 2. Access	Attr 3-9. Access	K351C	K382M	OMNIPOWER 1- and 3 phase	OMNIPOWER CT

4.2 Read Load Profile logger using Level security

The following example shows how to read the load profile logger (attribute 2 of OBIS 1.1.99.1.0.255) from a K351C using default DLMS address and **Primary Module interface Association with Low Level security**. This example is using selective access (Access Selector =1). Read Buffer from date 25 Okt. 2013 to date 26 Okt. 2013.
